CONSOLIDATED REPORT

Dynamics of Estonia’s Façade, Aluminium Structures, Window and Door Market, 2021–2025

Study period: 2021, 2024 and 2025 Geography: Estonia, including the export activities of the companies examined Research basis: annual reports of selected large, medium-sized and small companies; Estonia’s construction price index Objective: assess trends in company turnover, profitability and financial stability; determine the impact of inflation; and identify the market’s main trends.

1. Executive Summary

Between 2021 and 2025, Estonia’s market for façades, aluminium structures, windows and doors went through several stages: recovery and growth after the pandemic period, a sharp increase in construction costs in 2022, slower business activity and stronger price competition in 2023–2024, followed by a partial recovery in turnover in 2025.

The annual reports show that an increase in nominal revenue did not always translate into higher profit. Several companies increased turnover but experienced losses, declining profitability and weaker balance-sheet positions.

For the comparable sample of nine companies—four large and five medium-sized—combined nominal turnover was approximately:

Year	Combined turnover
2021	€36.81 million
2024	€38.79 million
2025	€40.38 million

From 2021 to 2025, nominal turnover in this sample increased by approximately 9.7%.

Over the same period, construction prices in Estonia rose by approximately 28.9%. After adjusting turnover using the construction price index, the sample’s combined revenue in 2021 prices was about €31.33 million in 2025, compared with €36.81 million in 2021.

Thus, turnover in real terms, adjusted using the construction price index, was approximately 14.9% below its 2021 level.

This result should not be interpreted as an exact 14.9% decline in the physical volume of façade work. The construction index is not a dedicated price index for façade systems, and the sample does not cover the entire market. Nevertheless, the calculation indicates that nominal sales growth did not offset the general increase in construction costs.

Key finding: in 2025, the companies examined recovered part of their nominal turnover, but the recovery in profitability and real activity levels was uneven.

2. Research Methodology

2.1. Years Covered

The years selected for comparison are 2021, 2024 and 2025.

2021 is used as the base period. 2024 provides a view of companies after a period of high inflation and weaker construction activity. 2025 shows the extent to which companies were able to recover turnover and profitability.

However, comparing three individual years does not fully capture the intervening trends. For a more detailed analysis, data for 2022 and 2023 should be added in the future.

2.2. Company Grouping

The companies are divided into three groups:

1. Large companies: METEK OÜ, Warmeco OÜ, Semity OÜ and Malmerk Fassaadid AS.

2. Medium-sized companies: Espak Alumiinium OÜ, Lariaare Alumiinium OÜ, LÜMICO OÜ, Osaühing Koduaken and OÜ INTEXGLAS.
3. Small companies: MR Profiil OÜ and Alucon OÜ are included in the preliminary quantitative sample.

This grouping is used for analytical comparison and is not an official classification based on employee numbers or turnover.

2.3. Sample Limitations

The sample is not a complete register of all façade, window and door manufacturers in Estonia.

It includes companies with different specialisations: manufacturers of aluminium structures, glass façades, plastic windows and doors, and companies operating in adjacent fields.

Consequently, the combined turnover of the selected companies is not an official estimate of the market size.

In addition, the available material does not include a 2025 report for Fenster Alumiinium AS, while changes in Malmerk Fassaadid AS's operating structure require particular caution when interpreting its trends.

3. Macroeconomic Conditions and Inflation

3.1. Rising Construction Costs

According to Statistics Estonia, the annual changes in the construction price index were:

Year	Change in construction price index
2021	+8.3%
2022	+17.8%
2023	+6.1%
2024	+1.6%
2025	+1.5%

The construction price index was already rising rapidly in 2021. The largest increase occurred in 2022, when construction costs rose by 17.8%. Prices continued to rise in 2023, but at a slower rate of 6.1%. The pace moderated considerably in 2024–2025.

According to Statistics Estonia, in 2025 labour costs rose by 1.7%, construction machinery by 1.9%, and construction materials by 1.1%.

Sources: Statistics Estonia, Construction prices grew by 17.8% last year (23 January 2023), Higher cost of materials had the biggest impact on the rise in construction prices last year (23 January 2024), Construction prices rose by 1.6% in 2024 (21 January 2025), and Construction prices rose by 1.5% last year (21 January 2026).

3.2. Cumulative Price Change

Compounding the annual changes in the construction price index gives the following approximate trend relative to 2021:

Year	Construction price index, 2021 = 100
2021	100.0
2022	117.8
2023	125.0
2024	127.0
2025	128.9

Thus, the average level of construction prices in 2025 was approximately 28.9% higher than in 2021.

To maintain the same volume of purchases and work, a company generally needed more money than in 2021. However, the actual cost change for a particular façade system may differ from the overall index because prices for aluminium profiles, glass, hardware, energy and installation work do not move uniformly.

3.3. Overall Consumer Inflation

For additional comparison, Estonia's consumer price index can be used. Annual inflation was approximately 19.4% in 2022, 9.2% in 2023, 3.5% in 2024 and 4.8% in 2025.

The cumulative increase in consumer prices over 2021–2025 was approximately 41.4%.

This measure is useful for assessing overall purchasing power, but the construction price index is a more appropriate primary benchmark for analysing construction-sector companies.

4. Performance of Large Companies

The large-company group comprises METEK OÜ, Warmeco OÜ, Semity OÜ and Malmerk Fassaadid AS.

Combined turnover for this group was approximately €25.30 million in 2021, €27.48 million in 2024 and €28.03 million in 2025.

Nominal turnover increased by approximately 10.8% between 2021 and 2025. In 2025, the increase compared with 2024 was about 2%.

Thus, the large-company group maintained positive nominal turnover growth, although its growth rate in 2025 was considerably lower than that of the medium-sized group.

4.1. METEK OÜ

METEK increased turnover from approximately €9.87 million in 2024 to €11.10 million in 2025. However, net profit fell from approximately €324,000 to €259,000.

This means that higher sales did not produce a proportional increase in profit. Possible explanations include higher production costs, a change in the order mix and pricing pressure; identifying the actual causes requires a more detailed review of cost items.

METEK has demonstrated an ability to grow turnover, but further assessment should take profitability and cost trends into account.

4.2. Warmeco OÜ

Warmeco’s turnover increased from approximately €7.60 million in 2024 to €10.15 million in 2025. The company moved from a loss to a profit.

This is one of the most notable results in the large-company group. However, the reports indicate that large projects played a significant role. The company’s result should therefore not automatically be taken as evidence of a broad-based market recovery.

4.3. Semity OÜ

In 2025, Semity’s turnover fell to approximately €2.50 million and its loss was about €235,000.

The company is experiencing difficulties with workload and profitability, although its report indicates a substantial future order book.

To assess its prospects, it is necessary to monitor not only announced future projects but also actual revenue, contract margins, cash flow and equity.

4.4. Malmerk Fassaadid AS

Malmerk Fassaadid AS specialises in manufacturing and installing aluminium-profile structures, including glass façades, glazed roofs, conservatories, windows and doors.

The company’s turnover was €4.37 million in 2021, €6.63 million in 2024 and fell to €4.27 million in 2025.

In its 2024 report, management described an extremely difficult competitive environment: the company sought to maintain sales volumes but had to reduce prices, causing many projects to become loss-making.

In 2025, the company continued to scale back its operations. Some employees and equipment were transferred to the related company Malmerk Klaasium OÜ, and Malmerk Fassaadid was expected to operate at a substantially lower turnover level going forward.

Therefore, the decline in Malmerk Fassaadid’s turnover should not be interpreted entirely as a loss of market orders. A consolidated analysis of the Malmerk group should include the related company’s activity and eliminate intra-group transactions.

5. Performance of Medium-Sized Companies

The medium-sized group includes Espak Alumiinium OÜ, Lariaare Alumiinium OÜ, LÜMICO OÜ, Osaühing Koduaken and OÜ INTEXGLAS.

5.1. Combined Turnover

Company	2021	2024	2025
Espak Alumiinium OÜ	€1.153 million	€1.281 million	€1.162 million
Lariaare Alumiinium OÜ	€2.272 million	€2.353 million	€2.957 million
LÜMICO OÜ	€2.867 million	€3.146 million	€3.812 million
Osaühing Koduaken	€4.536 million	€3.499 million	€3.594 million
OÜ INTEXGLAS	€0.684 million	€1.026 million	€0.823 million
Total	€11.512 million	€11.304 million	€12.348 million

The group’s combined turnover declined by approximately 1.8% between 2021 and 2024, then increased by 9.2% in 2025. Nominal growth over the full period was about 7.3%.

Thus, the medium-sized group recorded stronger turnover growth in 2025 than the large-company group.

5.2. Combined Profitability

Company	Profit / loss 2021	2024	2025
Espak Alumiinium OÜ	€5,200	€4,200	€6,100
Lariaare Alumiinium OÜ	€32,300	€47,700	−€76,700
LÜMICO OÜ	€175,200	−€56,400	€251,000
Osaühing Koduaken	€158,000	−€122,400	−€124,400
OÜ INTEXGLAS	−€87,400	€11,400	€800
Total	€283,400	−€115,500	€56,800

In 2024, the five companies recorded a combined loss of approximately €115,000. In 2025, the combined result returned to positive territory, but amounted to only about €57,000.

This is substantially below the combined profit recorded in 2021. Therefore, the recovery in sales in 2025 does not yet indicate a return to previous profitability.

5.3. LÜMICO OÜ

LÜMICO’s turnover increased from €3.15 million in 2024 to €3.81 million in 2025. After a loss of approximately €56,000 in 2024, the company recorded a profit of about €251,000 in 2025.

This represents a strong recovery in both turnover and financial results.

The company’s core activity is the manufacture of plastic windows, doors and partitions. Its results are therefore useful for assessing the broader window and door market, but cannot be used directly as an indicator of trends in aluminium-and-glass façades alone.

5.4. Lariaare Alumiinium OÜ

Turnover increased from €2.35 million in 2024 to €2.96 million in 2025, representing growth of approximately 25.7%.

Despite higher sales, the company moved from a profit of approximately €47,700 to a loss of about €76,700.

The report notes a substantial increase in expenses for materials and services. This shows that turnover growth alone does not guarantee an improved financial result.

5.5. Osaühing Koduaken

Koduaken’s turnover declined from €4.54 million in 2021 to €3.50 million in 2024, then recovered slightly to €3.59 million in 2025.

The company recorded a loss of approximately €122,000 in 2024 and €124,000 in 2025.

According to the report, equity fell to approximately €58,000 while liabilities increased. This indicates that the company’s financial stability deteriorated significantly compared with 2021.

5.6. OÜ INTEXGLAS

INTEXGLAS's turnover declined from €1.03 million in 2024 to €823,000 in 2025. Profit fell from approximately €11,400 to €800.

In its 2025 report, management attributes lower sales to a cooling construction market, reduced project volumes and stronger price competition.

This is direct evidence of pressure on a participant in the glass and aluminium structures segment.

5.7. Espak Alumiinium OÜ

Espak Alumiinium's turnover declined from €1.28 million in 2024 to €1.16 million in 2025. Profit was approximately €6,100, corresponding to a margin of about 0.5%.

The company remains operational, but its financial result is highly sensitive to changes in material, wage and other production costs.

6. Small Companies

The preliminary sample of small companies includes MR Profiil OÜ and Alucon OÜ.

Company	Turnover 2021	Turnover 2024	Turnover 2025	Profit 2025
MR Profiil OÜ	€83,500	€347,200	€705,500	€25,900
Alucon OÜ	Not yet established	€149,800	€277,000	€20,900
Total based on available data	€83,500	€497,000	€982,500	€46,800

MR Profiil recorded rapid turnover growth, from €347,000 in 2024 to €706,000 in 2025.

After a substantial decline in sales in 2024, Alucon recovered turnover to €277,000 in 2025, but remained below its 2023 level.

These results show that some small companies can increase turnover rapidly. However, a two-company sample is too small to assess the entire small-company segment.

Alucon's specialisation should also be considered separately: its core activity is the manufacture of other metal structures, so not all of its turnover necessarily belongs to the façade market.

Luminum OÜ and All Solutions OÜ were also reviewed, but their activities should not automatically be included in the turnover of the specialist façade market. Luminum is associated with engineering design and consulting, while All Solutions reports non-specialised retail trade. They can be analysed separately, but should only be included in the manufacturing sample where a justified link to the segment under review can be established.

7. Comparison of Large and Medium-Sized Companies

The combined indicators for the two main groups are shown below.

Group	2021	2024	2025	Change 2021–2025
Large, 4 companies	€25.30 million	€27.48 million	€28.03 million	+10.8%
Medium-sized, 5 companies	€11.51 million	€11.30 million	€12.35 million	+7.3%
Total, 9 companies	€36.81 million	€38.79 million	€40.38 million	+9.7%

In nominal terms, the combined turnover of the nine selected companies increased by €3.57 million between 2021 and 2025.

However, this trend reflects not only changes in work volume, but also changes in prices, order mix and the activities of individual companies.

In 2025, the medium-sized group recorded a higher growth rate than the large-company group. Within the medium-sized group, however, there were both substantial sales increases and turnover declines and losses.

It is therefore not possible to conclude that the market recovery was uniform. Results vary considerably between companies and depend on their specialisation, order mix and project execution efficiency.

8. Adjusting Turnover for Construction Inflation

Estonia’s construction price index is used to compare turnover in real terms.

The cumulative index for 2022–2025, relative to the 2021 average, is approximately 128.9.

To express turnover in 2021 prices, each year’s nominal turnover is divided by the corresponding index expressed as a coefficient.

8.1. Calculation for the Nine Companies

Indicator	2021	2024	2025
Nominal turnover	€36.81 million	€38.79 million	€40.38 million
Construction price index, 2021 = 100	100.0	127.0	128.9
Turnover in 2021 prices	€36.81 million	€30.55 million	€31.33 million
Real change vs 2021	—	−17.0%	−14.9%

Nominal turnover increased by 9.7%, but after adjustment for construction inflation it was approximately 14.9% below the 2021 level.

A partial recovery was observed in 2025: real turnover increased compared with 2024, but remained substantially below the base-period level.

8.2. Interpretation

The result should be interpreted as an estimate of turnover at constant prices, not as a direct measure of the physical number of windows, doors and façades manufactured.

If prices for specific façade systems rose more slowly than the overall construction index, the actual change in volume may have been better than this calculation suggests. If profiles, glass, hardware or installation work became more expensive faster than the index, the actual situation may have been worse.

A more accurate assessment of physical trends would require data on production volumes, façade area, numbers of installed structures and selling prices.

9. Main Market Risks

9.1. Price Competition

Several company reports explicitly note intensifying competition and the need to lower prices to win orders.

The clearest example is Malmerk Fassaadid AS, where efforts to maintain sales volumes were accompanied by price reductions and loss-making projects.

This means that turnover can increase at the expense of margins rather than through improved efficiency.

9.2. Rising Costs

Even after overall inflation slowed, labour, equipment and material costs continued to rise.

When margins are low, even a small increase in costs can result in a loss. This is particularly evident at Espak Alumiinium and INTEXGLAS, where 2025 profit was very small relative to turnover.

9.3. Dependence on Large Projects

For large manufacturers, financial results can vary substantially depending on the completion dates of a few major projects.

A single company’s turnover growth therefore does not always reflect the market as a whole. The order book, project margins and actual delivery schedules should also be considered.

9.4. Financial Stability

Prolonged losses reduce equity and may increase a company’s dependence on lenders and supplier payment extensions.

Particular attention should be paid to companies that are simultaneously experiencing falling sales, losses and growing liabilities.

An assessment of stability should track equity, current liabilities, cash, accounts receivable and the ability to meet current payments.

9.5. Changes in Corporate Structure

The transfer of activities between related legal entities can distort the reported indicators of an individual company.

The example of Malmerk Fassaadid and Malmerk Klaasium shows that accurate analysis sometimes requires treating a group of companies as a single economic entity and eliminating intra-group transactions.

10. Conclusions by Segment

Large Companies

The large-company group maintained nominal turnover growth between 2021 and 2025. However, growth in 2025 was moderate, and individual companies' results differed substantially.

METEK and Warmeco recorded sales growth, while Semity experienced financial difficulties. The transfer of activities must be taken into account for Malmerk.

Medium-Sized Companies

In 2025, the medium-sized group recovered turnover after the decline in 2024. The recovery in profitability, however, was weak.

LÜMICO delivered a strong positive result; Lariaare increased turnover but moved into a loss; Koduaken continued to report losses; INTEXGLAS reduced sales; and Espak Alumiinium recorded a low margin.

This indicates substantial variation within the medium-sized group.

Small Companies

MR Profiil and Alucon increased turnover in 2025. However, the sample is too small to draw conclusions about the entire small-manufacturer segment.

A broader sample of companies with a confirmed specialisation in windows, doors and façade structures is required for a conclusive assessment.

11. Overall Conclusions

The findings support the following conclusions.

1. In 2025, nominal turnover among the selected large and medium-sized companies was above the 2021 level.
2. Construction inflation materially changes the interpretation of financial trends: after adjustment, the sample's combined turnover was approximately 14.9% below the 2021 level in base-period prices.
3. Sales recovered in 2025, but profitability did not recover uniformly.
4. There are substantial differences between companies in the sector: some are growing rapidly, while others are reducing turnover or operating at a loss.
5. Competition for orders and price pressure remain important risk factors.
6. Changes in the structure of related companies require data consolidation; otherwise, individual indicators may be misleading.
7. The results describe the selected company sample and do not constitute a complete assessment of the Estonian market.

Final conclusion: the selected manufacturers of windows, doors, aluminium structures and façades showed a nominal recovery in 2025, but after adjustment for construction inflation, combined turnover remains below the 2021 level. The sector's main challenge is not only sales performance, but also companies' ability to maintain profitability amid high costs and intense price competition.
